

POCKET LEDGER

Your expenses. Your sheet. Your control.

Complete User Guide

A simple, private setup for Android and iPhone users.

START HERE

1. Make your own Google Sheet copy. 2. Deploy your personal Apps Script Web App. 3. Connect Pocket Ledger and test it before your first expense.

Your data stays yours

Each person makes their own Sheet copy and uses their own Apps Script Web App URL. Pocket Ledger does not send everyone to one shared creator Sheet.

Support: @TechyBist

A personal flow, not a shared database.

Pocket Ledger is designed around a Google Sheet you control. Your phone records an expense only after the Web App URL for your own Sheet confirms it.

You own the Sheet and deploy your own personal Web App URL.

Before you begin

You need a Google account, access to a laptop or desktop for the first Google Sheet setup, and your Android phone or iPhone.

What gets recorded

Date, month, time, category, amount, payment mode, remark, and device name are sent to your personal Sheet after a confirmed save.

Create the place your expenses will live.

Do this first on a laptop or desktop. The template copy becomes your private working Sheet and includes the supplied structure, formulas, formatting, and dashboard content.

- 1** Make your copy
Open the Make Your Copy link from the Pocket Ledger website. Google creates a copy in your own Drive.
- 2** Open Apps Script
In your copied Sheet, choose Extensions > Apps Script.
- 3** Add the supplied script
Use the included Pocket Ledger Apps Script material for your personal copied Sheet.
- 4** Deploy as a Web App
Choose Deploy > New deployment, select Web App, and complete the Google deployment flow.
- 5** Copy your personal URL
Copy the deployed Web App URL. You will paste this into Android or configure it in the iPhone Shortcut.

Keep this URL private

It connects a phone to your own Sheet. Do not share a personal deployment URL publicly.

Connect the native Pocket Ledger app.

Pocket Ledger for Android is a native APK. It does not require MacroDroid or continuous background monitoring.

- 1** Install the APK
Download and install Pocket Ledger for Android from the distribution website.
- 2** Open Settings
From the Pocket Ledger home screen, open Settings.
- 3** Add your Web App URL
Choose Apps Script Web App URL and paste the personal URL from your Google deployment.
- 4** Set Device Name
Choose Device Name and use a clear label such as My Android or Dad's phone.
- 5** Test Connection
Choose Test Connection before starting. It checks whether the configured endpoint can be reached.

Current Android settings screen

Configure the Apps Script Web App URL, Device Name, categories, payment modes, defaults, and diagnostics here.

Open direct entry in the way that suits you.

Every Android quick-access option goes to the same focused Add an expense flow. It does not make the app monitor your phone in the background.

- 1** Home-screen widget
Touch and hold an empty area on your Android home screen, choose Widgets, then add Pocket Ledger's Add Expense widget.
- 2** Launcher shortcut
Touch and hold the Pocket Ledger app icon. Drag Add Expense to your home screen if your launcher supports it.
- 3** Quick Settings tile
Swipe down twice, choose Edit, then add the Pocket Ledger Add Expense tile.
- 4** In-app action
Open the app and tap Add expense from the home screen.

Current Android home screen

The Add expense button opens the direct-entry sheet. The same destination is used by the widget, shortcut, and Quick Settings tile.

Make the entry flow feel like yours.

In Settings, manage Categories and Payment Modes. You can add, rename, change the emoji, delete, and reorder each list. Set defaults to reduce taps on common expenses.

Emoji format

Pocket Ledger stores and sends category and payment labels in text-then-emoji format, for example: Food & Dining 🍴 and UPI 💰.

Adding an expense

- 1** Enter amount
Use a positive amount.
- 2** Choose category and payment mode
Pick your configured values.
- 3** Add a remark if useful
Remarks are optional.
- 4** Review and save
Confirm the details. The app sends the request immediately.
- 5** Wait for confirmation
Expense saved means the Google Sheet endpoint returned a confirmed success. If it fails, correct the issue and retry without losing the entry.

Current direct-entry sheet

Amount, category, payment mode, optional note, then Review & save. The success state appears only after server confirmation.

Use the supplied original Shortcut.

Pocket Ledger on iPhone uses Apple's built-in Shortcuts app. There is no separate Pocket Ledger iOS app to install.

- 1** Get the original Shortcut
Download Pocket-Ledger-iPhone.shortcut from the distribution website and open it with Shortcuts.
- 2** Configure your personal Web App URL
Follow the supplied Shortcut workflow and enter the personal Apps Script Web App URL from your copied Sheet.
- 3** Optionally set Device Name
Use a useful label such as iPhone, Mom, or Work phone so your Sheet identifies the source.
- 4** Optionally add Back Tap
If your iPhone supports it, you may assign the Shortcut in iOS Back Tap settings for faster access.
- 5** Test before daily use
Run the configured Shortcut once and confirm the personal Sheet receives the entry.

Use your own endpoint

The iPhone Shortcut must point to your personal Apps Script Web App URL, not another person's Sheet or deployment.

The Shortcut file in the distribution package is the supplied original Shortcut. Its actions are not recreated or changed.

One Sheet can serve more than one device.

Open the Expense Analytics Dashboard in your copied Google Sheet to view the template's existing dashboard, filters, and date controls. Your submitted transactions appear in the Transactions sheet.

Multiple devices

You and your family can connect Android and iPhone devices to the same personal Web App URL if you want them to write to one copied Sheet. Give every device a distinct Device Name so rows stay understandable.

A helpful convention

Examples: My Android, Priya iPhone, Dad's Pixel. Update Device Name inside Android Settings or the iPhone Shortcut configuration.

Privacy reminder

Your copied Sheet, Google account, and personal deployment decisions control who can access your expense data. Keep sharing and deployment permissions appropriate for the people you intend to use the Sheet.

A calm checklist when something needs attention.

Connection test fails

Confirm the Apps Script Web App URL is HTTPS, copied completely, and the deployment is available to the intended users.

Connection test succeeds but save fails

The test checks reachability. Review the Apps Script deployment and make sure the supplied script is in the copied Sheet and returns Success after a save.

Android cannot install the APK

Use the distribution download on your Android phone and follow your phone's normal installation prompts for an APK from this source.

Wrong device appears in the Sheet

Update Device Name in Android Settings or the iPhone Shortcut, then submit a new entry.

Quick setup checklist

- 1** Choose Android or iPhone
Download the correct release item.
- 2** Make your own Sheet copy
Use the Make Your Copy button.
- 3** Deploy Apps Script
Create your personal Web App URL.
- 4** Configure your device
Paste your URL and set Device Name.
- 5** Test and begin
Confirm the connection, then save your first expense.

Need help?

Support: @TechyBist. Include a copied Diagnostics report from Android Settings when available, but do not share your personal Web App URL publicly.

Pocket Ledger - simple expense entry, powered by the Google Sheet you own.
